

REFLECTION

reflection
(noun)

The throwing back by a body or surface of light, heat, or sound without absorbing it.
"the reflection of light"

Reflection is the natural phenomenon that occurs around us all the time. The beauty of these reflections lies in the journey of the reflected ray, or the path it takes. The most important aspect however is the point of reflection, the point that forms the image, the point that makes all the difference.

As architects, we put our heart and soul in the designing process. But, the most crucial step in the journey is how we reflect our ideas into the built form.

This 60th year of NASA India, we need to look back at our journey, and understand our strengths. After working around themes like Transformation, Re Evolution and Parallel Projections, which have strengthened the core of the association, we have now reached the crucial point of reflection.

It is through **Reflection** that we can keep the continuity of NASA India's thematic work with these ideas of light, processes and multiplicity.

The 60th council will work towards the vision of becoming the voice of architecture students in the country, by giving back or reflecting the progress we have made. NASA India should be a pure mirror which will let the students see a better creator in themselves and all the things that they have behind them.
